

CASE STUDY

# Case Study for Leading French IT Company

## Company Background

A leading French information technology company delivering software solutions across areas such as business activity monitoring and web API management. With over 25 years in operation and more than 2,000 employees, the company supports clients worldwide with a diverse portfolio of digital tools.

## THE CHALLENGE

# Disrupted development timelines

With globally distributed teams—spanning over 100 different team types—the company faced significant logistical hurdles when it came to threat modeling. Collaboration often required flying personnel around the world, consuming an entire week to complete a single threat model. This approach was not only costly in terms of travel but also disrupted development timelines by pulling engineers away from active projects. As a result, only a limited number of products were being threat modeled, prompting the search for a scalable, developer-friendly solution.

## THE SOLUTION

# Automation and collaborative capabilities

IriusRisk enabled the IT company to implement a scalable threat modeling program across its entire product suite. The platform's automation and collaborative capabilities removed the need for in-person workshops, allowing teams to work together effectively—regardless of location. With IriusRisk, threat modeling could be conducted faster and more frequently, significantly expanding coverage across all products.

## Seamless collaboration between teams worldwide

- Team collaboration: Seamless collaboration between teams worldwide, without the need for travel
- Time and cost savings: Reduced travel expenditure and freed up development capacity
- Scalability: Ability to threat model a large number of products efficiently and consistently

“

***For the first time we were really able to scale and put a program in place where we could really take care of all of our products and look at things when we needed to. It's been so beneficial for us.***

# Key Reasons for Using IriusRisk

Enabled scalable,  
remote-first threat modeling  
across global teams

Easy for development teams  
to adopt and integrate into  
existing workflows

Significantly reduced time  
and cost per threat  
model

Supported rapid threat  
modeling for a broad range  
of products
